

1	<p><u>Doping</u>: The deliberate addition of a desirable impurity is called doping.</p> <p>Types of atoms: 1. Pentavalent – Phosphorus (P) and 2. Trivalent – Boron (B)</p>	<p>½</p> <p>½</p>
2	<p>(a) (i) <u>Isotopes</u>: The nuclides having same number of protons (Z) but differing in mass number A are called isotopes.</p> <p><u>Isobars</u>: All nuclides with same mass number A are called isobars.</p> <p>(ii) Not Necessarily, For different values of mass number (A), we can have different values of Atomic Number (Z). For example: ${}^6_3\text{Li}$ and ${}^4_2\text{He}$; they have different A and Z.</p> <p style="text-align: center;">OR</p> <p>(b) (i) Factors:</p> <ol style="list-style-type: none"> 1. Work function of the metal 2. frequency of incident radiations <p>(ii) it is the minimum frequency of incident radiation below which no photoelectric emission can take place.</p>	<p>½</p> <p>½</p> <p>1</p> <p>1</p> <p>1</p>
3	 <p>The diagram illustrates a p-n junction. On the left is the p-region (labeled 'p') and on the right is the n-region (labeled 'n'). A central depletion region is shown with positive and negative space charges. Arrows indicate 'Electron diffusion' from n to p, 'Electron drift' from p to n, 'Hole diffusion' from p to n, and 'Hole drift' from n to p. A large 'NOW' watermark is present on the right side of the diagram.</p> <p>Due to the diffusion of electrons and holes, from their majority zone to minority zone, a layer of positive and negative space charge region on either side of the junction is formed. This is called the depletion region or layer.</p> <p>The loss of electrons, from n-region and gain of electrons by the p-region, causes a difference of potential across the junction. This tends to prevent the movement charge carriers across the junction and is, therefore, termed as barrier potential.</p>	<p>½</p> <p>½</p> <p>1</p> <p>1</p>
4	<p>Bohr's postulate:</p> <ol style="list-style-type: none"> (i) Bohr's first postulate was that an electron in an atom could revolve in certain stable orbits without the emission of radiant energy. (ii) Quantization of angular momentum: This postulate states that the electron revolves around the nucleus only in those orbits for which the angular momentum is some integral multiple of $h/2\pi$ where h is the Planck's constant ($= 6.6 \times 10^{-34} \text{ J s}$). That is $L = nh/2\pi$ (iii) When an electron makes a transition from one of its specified non-radiating orbits to another of lower energy, a photon is emitted having energy equal to the energy difference between the initial and final states. $h\nu = E_i - E_f$ <p>Electrons are revolving around the nucleus because of centripetal force which is provided by electrostatic attraction between electron and positive nucleus</p>	<p>1</p>

	$\frac{mv^2}{r} = \frac{1}{4\pi\epsilon_0} \cdot \frac{(Ze) \times e}{r^2}$ $r = \frac{kZe^2}{mv^2} \dots\dots(1)$ <p>According to quantization of angular momentum</p> $mvr = \frac{nh}{2\pi}$ $r = \frac{nh}{2\pi mv} \dots\dots(2)$ <p>From equation (1) and (2)</p> $\frac{kZe^2}{mv^2} = \frac{nh}{2\pi mv}$ $v = \frac{2\pi kZe^2}{nh}$ <p>All other values are constant except n Hence</p> $v \propto \frac{1}{n}$ <p style="text-align: center;">where n = principal quantum number</p>	<p>1</p> <p>1</p>
5	 <p>Working: The generation of emf by a solar cell, when light falls on, it is due to the following three basic processes:</p> <p>(i) Generation : Generation of e-h pairs due to light (with $h\nu > E_g$) close to the junction.</p> <p>(ii) Separation: Separation of electrons and holes due to electric field of the depletion region. Electrons are swept to n-side and holes to p-side;</p> <p>(iii) Collection: The electrons reaching the n-side are collected by the front contact and holes reaching p-side are collected by the back contact. Thus p-side becomes</p>	<p>2</p>

positive and n-side becomes negative giving rise to *photo-voltage*.

When an external load is connected as shown a photocurrent I_L flows through the load.

A typical I - V characteristics of a solar cell is shown in figure.

6 Energy of proton $E = 4.1 \text{ MeV} = 4.1 \times 10^6 \text{ eV}$

(i) Speed of the proton = kinetic energy of proton $= \frac{1}{2}mv^2$

$$4.1 \times 10^6 \times 1.6 \times 10^{-19} = \frac{1}{2}mv^2$$

$$\frac{2 \times 4.1 \times 10^6 \times 1.6 \times 10^{-19}}{m} = v^2$$

$$v = \sqrt{\frac{2 \times 4.1 \times 10^6 \times 1.6 \times 10^{-19}}{m}}$$

$$v = \sqrt{\frac{2 \times 4.1 \times 10^6 \times 1.6 \times 10^{-19}}{1.6 \times 10^{-27}}}$$

$$v = 2.8636 \times 10^7 \text{ m/s}$$

(ii) K.E. = P.E.

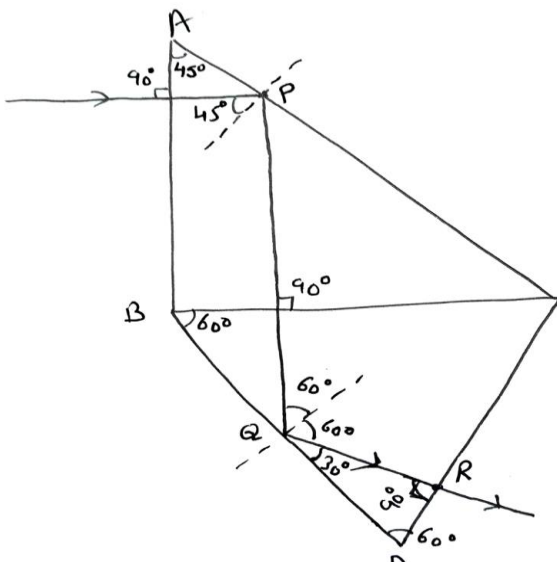

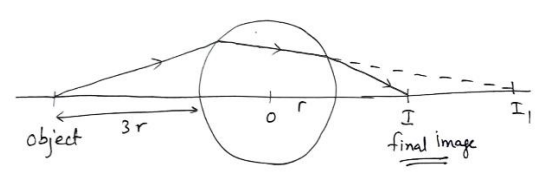

$$\text{K.E.} = \frac{2kZe^2}{r}$$

$$r = \frac{2kZe^2}{\text{K.E.}}$$

$$r = \frac{2 \times 9 \times 10^9 \times 82 \times (1.6 \times 10^{-19})^2}{4.1 \times 10^6 \times 1.6 \times 10^{-19}}$$

$$r = 576 \times 10^{-16} \text{ m}$$

1½

	$r = 5.76 \times 10^{-14} \text{ m}$	1½
7	<p>(I) $\text{angular width of central maximum} = \frac{2\lambda}{a}$ $\lambda_{\text{orange}} > \lambda_{\text{green}}$ Hence angular width of central maximum will increase.</p> <p>(II) $\text{angular width of central maximum} = \frac{2\lambda}{a}$ It does not depend of distance between slit and screen hence no change in angular width.</p> <p>(III) $\text{angular width of central maximum} = \frac{2\lambda}{a}$ If Slit width a is decreased then Angular width of central maximum will increase.</p>	<p>1</p> <p>1</p> <p>1</p>
8	<p>(a) 1. Light rays must travel from denser medium to rarer medium 2. angle of incidence must be greater than critical angle</p> <p>(b) For surface AC: at point P, $i > i_c$; hence ray will suffer total internal reflection. For surface BD: at point Q; again $i > i_c$; hence ray will suffer total internal reflection. For surface DC: ray will be normal to DC.</p>  <p style="text-align: center;">OR</p> <p>(c) (i) for negative: object should be placed at any point beyond focus (F). (ii) for positive: object should be placed between focus (F) and optical center.</p> <p>(b)</p> 	<p>½</p> <p>½</p>
9	<p>(i) $\lambda = \frac{12.27}{\sqrt{V}} \text{ Å} = \frac{12.27}{\sqrt{100}} \text{ Å} = 1.227 \text{ Å}$</p> <p>(ii) Momentum, $p = h/\lambda = \frac{6.63 \times 10^{-34}}{0.1227 \times 10^{-9}} \text{ kg-ms}^{-1} = 54.03 \times 10^{-25} \text{ kg-ms}^{-1}$.</p>	<p>1</p> <p>1</p>

	Velocity acquired, $v = \frac{h}{m\lambda} = \frac{h}{\lambda} \times \frac{1}{m} = 54.03 \times 10^{-25} \times \frac{1}{9.1 \times 10^{-31}} = 5.937 \times 10^6 \text{ m/s.}$			1												
10	(i)	$\beta = \lambda D/d = (600 \times 10^{-9} \times 1.6)/(0.8 \times 10^{-3}) = 1.2 \times 10^{-3} \text{ m} = 1.2 \text{ mm.}$		1												
	(ii)	(a) Distance of third minimum, $y_3 = (n - \frac{1}{2}) \lambda D/d = (3 - \frac{1}{2}) \times 1.2 \text{ mm} = 3 \text{ mm.}$		1												
		(b) Distance of the fifth maximum, $y_5 = n \lambda D/d = 5 \times 1.2 \text{ mm} = 6 \text{ mm.}$		1
